

# Week 4 Assignment

*The week 4 assignment is due end of day on Sunday February 22<sup>nd</sup>. You may work in a small group on the assignment.*

Please use the tables in the `flights` database. Your deliverable should include a single SQL query that I can run against a “fresh copy” of the tables in the `flights` database.

*We'll look together at some of the most interesting student solutions in our office hours on Wednesday February 18<sup>th</sup>.*

*There are a number of issues with data that is incorrect or missing in the tables of the `flights` database. In this week's assignment, you're asked to show off your new found knowledge of insert, updating, and deleting rows by identifying, documenting, and correcting at least two problems with data in these tables. You should make changes to at least different tables. In-line comments in your SQL script are acceptable documentation.*

*You can decide how to handle outliers (research and replace with correct data or delete row, or take some kind of reasonable average value), but clearly document your method for each correction.*
